Base Model:
Less Self-Revision Behavior

In a triangular lattice with n = 4 divisions, the smallest n such that every subset of size n contains three forming an isosceles triangle is 7.

Final answer: \boxed{7}.

SRT Model:
***Explicit* Self-Revision Behavior**

… But in this set, A and E are symmetric with respect to the vertical axis through C. **Wait, this is wrong. Let me start over.** Okay, let's see…

Final answer: \boxed{6}.

SD-Zero Model (SRT + Self-Distillation):
***Internalized* Self-Revision / Self-Guidance**

… However, since it's an equilateral triangle, **coordinates might be a bit tricky**. Alternatively, **maybe it's easier to think of the grid as a lattice** where each division creates a grid of points…

Final answer: \boxed{6}.
